Economics of Mineral Exploration in Australia

Critical Mineral Resources of the United States

This book provides a framework for analyzing and forecasting a variety of mineral
and energy markets and related industries. Such modeling activity has been at the
forefront of the economic and engineering professions for some time, having
received a major stimulus following the first oil price shock in 1973. Since that
time, other shocks have affected these markets and industries, causing
disequilibrium economic adjustments which are difficult to analyze and to predict.
Moreover, geopolitics remains an important factor which can destabilize crude oil
markets and associated refining industries. Mineral and energy modeling,
consequently, has become a major interest of energy-related corporations, mining
and drilling companies, metal manufacturers, public utilities, investment banks, national government agencies and international organizations. This book hopes to
advance mineral and energy modeling as follows: (1) The modeling process is
presented sequentially by leading the model builder from model specification,
estimation, simulation, and validation to practical model applications, including
explaining history, analyzing policy, and market and price forecasting; (2) New
developments in modeling approaches are presented which encompass econometric
market and industry models, spatial equilibrium and programming models, optimal
resource depletion models, input-output models, economic sector models, and macro
oriented energy interaction models (including computable general equilibrium); (3)
The verification and application of the models is considered not only individually
but also in relation to the performance of alternative modeling approaches; and (4)
The modeling framework includes a perspective on new directions, so that the
present model building advice will extend into the future.

International Mineral Economics provides an integrated overview of the concepts
important for mineral exploration, mine valuation, mineral market analysis, and
international mineral policies. The treatment is interdisciplinary, drawing on the
fields of economics, geology, business, and mining engineering. Part I, Economic
Geology and Mineral Development, examines the technical concepts important for
understanding the geology of ore deposits, the methods of exploration and deposit
evaluation, and the activities of mining and mineral processing. Part II, Mineral
Economics, focuses on the economic and related concepts important for understanding
mineral development, the evaluation of exploration and mining projects, and mineral
markets and market models. Finally, Part III, International Mineral Policies, reviews and traces the historical development of the policies of international organizations, the industrialized countries, and the developing countries.

This book aims to provide engineers with an overview knowledge of disciplines such as sociopolitics, psychology, economics, and leadership. Engineers are disproportionately represented in senior management and in leadership roles, and many work outside typical engineering roles. Vital to their success are technical skills, but also, crucially, an understanding of the societal setting within which engineering takes place. Engineers that leverage their technical and analytical abilities with an understanding of the social context are enormously successful, both professionally and in terms of broader impact. This book originated from a recognition that this capacity of engineers can be enhanced with an understanding of the 'human forces', the phenomena that underpin and govern human interactions. The key ideas were assembled with domain experts from each field, to provide the key critical insights and how these might be practically applied by engineers. The authors provide the basis for the learning necessary to guide high-level strategic decisions, manage teams of diverse skillsets in complex environments, communicate in the context of management and decision-making, and to excel at the interface between a technical discipline and non-scientific fields. Prof. Andrej Atrens is Professor of Materials Engineering at The University of Queensland (UQ). He has experience in Universities and Research Institutes in Switzerland, Thailand, Canada, France, Germany, Sweden, China, USA, Fiji and Australia. Dr. Aleks Atrens is an Honorary Research Fellow at The University of Queensland (UQ). He earned his BE (Hons) in Chemical Engineering in 2007, and his PhD in 2011, both at UQ, where he has subsequently been a lecturer and researcher.

The Business of Mining complete set of three Focus books will provide readers with a holistic all-embracing appraisal of the analytical tools available for assessing the economic viability of prospective mines. Each volume has a discrete focus. This first volume presents an overview of the mining business, followed by an analysis of project variables and risk, an overall coverage of the royalty agreements, pricing and contract systems followed by a final chapter on accounting standards and practises for the minerals industry. The books were written primarily for undergraduate applied geologists, mining engineers and extractive metallurgists and those pursuing course-based postgraduate programs in mineral economics. However, the complete series will also be an extremely useful reference text for practicing mining professionals as well as for consultant geologists, mining engineers or primary metallurgists.

Automation in Mining, Mineral and Metal Processing covers the proceedings of the Third International Federation of Automatic Control (IFAC) symposium. The book discusses techniques and methods of automatic control and of system analysis for use in mining, mineral, and metal processing industries. Comprised of 69 chapters, the text presents theories, applications, operations, and maintenance of automation systems in an industrial environment. The topics covered are also relevant in solving various issues in the mining, mineral, and metal processing industries.
such as pollution, safety, energy efficiency, human resource, and materials through the implementation of an unmanned system. This book will be of great interest to professionals especially those who are contemplating the use of automated system.

*Sraffa and the Reconstruction of Economic Theory: Volume Two*

*Energy and Mineral Resources for the 21st Century*

Originally published in 1989. Professor Robinson begins by examining natural resource classification and the nature of return in mining, giving particular emphasis to different sources of long-run price changes in mining and their relevance for user cost and the economic treatment for exhaustible resources. He then traces the development of the economic theory of exhaustible resources from the last quarter of the eighteenth century to the first quarter of the twentieth, documenting the differing views of various authors about the future availability of mineral resources and the extent of user cost involved in their exploitation. He identifies a link between the perceived availability of exhaustible resources and the nature of the economic theory used to explain their exploitation. This book should be of interest to students and researchers of Economic Theory and Policy.

Essentials of Mineral Exploration and Evaluation offers a thorough overview of methods used in mineral exploration campaigns, evaluation, reporting and economic assessment processes. Fully illustrated to cover the state-of-the-art exploration techniques and evaluation of mineral assets being practiced globally, this up-to-date reference offers balanced coverage of the latest knowledge and current global trends in successful mineral exploration and evaluation. From mineral deposits, to remote sensing, to sampling and analysis, Essentials of Mineral Exploration and Evaluation offers an extensive look at this rapidly changing field. Covers the complete spectrum of all aspects of ore deposits and mining them, providing a "one-stop shop" for experts and students Presents the most up-to-date information on developments and methods in all areas of mineral exploration Includes chapters on application of GIS, statistics, and geostatistics in mineral exploration and evaluation Includes case studies to enhance practical application of concepts

*An Introduction to Mineral Economics*

Written on the occasion of the 50th anniversary of the publication of Piero Sraffa's Production of Commodities by Means of Commodities, the papers selected and contained in Sraffa and the Reconstruction of Economic Theory account for the work completed around the two central aspects of his contribution to economic analysis, namely the criticism of the neoclassical (or marginalist) theory of value and distribution, and the reconstruction of economic theory along the lines of the Classical approach. Divided into three volumes, Sraffa and the Reconstruction of Economic Theory debates the most fruitful routes for advancement in this field and their implications for applied and policy analysis. This second volume focuses on the theory of output and growth as developed in the modern classical approach on the basis of the extension to the long run of the Keynesian principle of effective demand, and on the implications of the revival of the classical approach for policy analysis and for understanding the evolution of the international economic order in the last few decades.

This book discusses current challenges in Japan, focusing on the nation’s rapidly aging population and low birth rate, along with persistent public bond issues with heavy interest payments, the potential collapse of social security systems, and income inequality, as well as the global picture. In turn, it examines the accessibility of global fossil fuels and feasibility of large-scale solar energy use. A new theory of money, interest, and capital is put forward, together with a proposal for an alternative system of international monetary cooperation, to promote a more sustainable and equitable world. Specific topics discussed include • the inverted population pyramid, due to the dramatic change in human life spans and declining birth rates; • the rapidly shrinking workforce, aging population, and declining GDP share sourced from industry; • disproportionate debt expansion due to public bond issues and coping with a persistent budget deficit; • the potential collapse of social security systems combined with income inequality; and • how to mitigate these bio-economic predicaments. Global Energy Sources offers an essential guide for policymakers, economists, researchers, and all those concerned with establishing a sustainable and equitable society from both energy and monetary perspectives. Further, it will be of interest to readers around the world, as the lessons learned from Japan are crucial to other developed societies that may eventually face the same types of challenge.

Mineral Resources Management and the Environment

Extant research continues to perpetuate a myth of Sub-Saharan African countries (SSACs) as ever stuck in the past and with incurable growth maladies. However, during the years just before the great global recession some of these countries performed better than countries in other regions. What explains this turnaround? How can it be ignited everywhere in the region and made to stick? The Political Economy of Economic Performance is among a few competitors that celebrate the successes of the region and argue for the positive economics of performance of at least some countries. Organized around two themes which are pursued in six chapters, the book provides a comprehensive, balanced, and thorough analysis of the factors and forces behind the unusually good performance of SSACs just before the great global recession, and shows that there is a way forward for them. The book makes a significant contribution to both policy and research, because while its structure is scholarly and logical, with a writing style that is coherent and easily understandable to all interested readers worldwide.

Australian Mineral Economics

This comprehensive textbook covers all major topics related to the utilization of
mineral resources for human activities. It begins with general concepts like definitions of mineral resources, mineral resources and humans, recycling mineral resources, distribution of minerals resources across Earth, and international standards in mining, among others. Then it turns to a classification of mineral resources, covering the main types from a geological standpoint. The exploration of mineral resources is also treated, including geophysical methods of exploration, borehole geophysical logging, geochemical methods, drilling methods, and mineral deposit models in exploration. Further, the book addresses the evaluation of mineral resources, from sampling techniques to the economic evaluation of mining projects (i.e. types and density of sampling, mean grade definition and calculation, Sichel’s estimator, evaluation methods – classical and geostatistical, economic evaluation – NPV, IRR, and PP, estimation of risk, and software for evaluating mineral resources). It subsequently describes key mineral resource exploitation methods (open pit and underground mining) and the mineral processing required to obtain saleable products (crushing, grinding, sizing, ore separation, and concentrate dewatering, also with some text devoted to tailings dams). Lastly, the book discusses the environmental impact of mining, covering all the aspects of this very important topic, from the description of diverse impacts to the environmental impact assessment (EIA), which is essential in modern mining projects.

Energy Sector: A Systemic Analysis of Economy, Foreign Trade and Legal Regulations

Written for students and professionals, this revised textbook surveys the mineral industry from geological, environmental and economic perspectives. Thoroughly updated, the text includes a new chapter on technology industry metals as well as separate chapters on mineral economics and environmental geochemistry. Carefully designed figures simplify difficult concepts and show the location of important deposits and trade patterns, emphasising the true global nature of mineral resources. Featuring boxes highlighting special interest topics, the text equips students with the skills they need to contribute to the energy and mineral questions currently facing society, including issues regarding oil pipelines, nuclear power plants, water availability and new mining locations. Technical terms are highlighted when first used, and references are included to allow students to delve more deeply into areas of interest. Multiple choice and short answer questions are provided for instructors online at www.cambridge.org/kesler to complete the teaching package.

Economic Management in Sub Saharan Africa

This book, based on lectures on natural and environmental resource economics, offers a nontechnical exposition of the modern theory of sustainability in the presence of resource scarcity. It applies an alternative take on environmental economics, focusing on the economics of the natural environment, including development, computation, and potential empirical importance of the concept of option value, as opposed to the standard treatment of the economics of pollution control. The approach throughout is primarily conceptual and theoretical, though empirical estimation and results are sometimes noted. Mathematics, ranging from
elementary calculus to more formal dynamic optimization, is used, especially in the
early chapters on the optimal management of exhaustible and renewable resources,
but results are always given an economic interpretation. Diagrams and numerical
examples are also used extensively. The first chapter introduces the classical
economists as the first resource economists, in their discussion of the
implications of a limited natural resource base (agricultural land) for the
evolution of the wider economy. A later chapter returns to the same concerns, along
with others stimulated by the energy and environmental “crises” of the 1970s and
beyond. One section considers alternative measures of resource scarcity and
empirical findings on their behavior over time. Another introduces the modern
cancept of sustainability with an intuitive development of the analytics. A chapter
on the dynamics of environmental management motivates the concept of option value,
shows how to compute it, then demonstrates its importance in an illustrative
empirical example. The closing chapter, on climate change, first projects future
changes and potential catastrophic impacts, then discusses the policy relevance of
both option value and discounting for the very long run. This book is intended for
resource and environmental economists and can be read by interested graduate and
advanced undergraduate students in the field as well.

Through an exploration of the links between geologic setting, mining and process
technologies, economics, environment and stakeholder communities, this text
addresses ways in which the mineral industry can be made safe, efficient and
ecologically sustainable, focusing in particular upon the following key themes: · a
review of the current status of the world mining industry, and the environmental
challenges it faces. · links between the mode of occurrence of a mineral and the
ways of mining it · the impact of mining on the environment in terms of industry
and waste · health consequences arising from the various hazards of mining · the
environmental impact of process technologies, and control technologies to make the
mining industry ecologically sustainable · methods of rehabilitation of mined land,
and reuse of mine wastes and mine water · socio-economic dimensions of the mining
industry.

This overview of Australasian economic thought presents the first analysis of the
Australian economic contribution for 25 years, and is the first to offer a
panoramic sweeping account of New Zealand economic thought. Those two countries,
both at the start of the twentieth century and at its end, excelled at innovative
economic practices and harbouring unique economic institutions. A History of
Australasian Economic Thought explains how Australian and New Zealand economists
exerted influence on economic thought and contributed to the economic life of their
respective countries in the twentieth century. Besides surveying theorists and
innovators, this book also considers some of the key expositors and builders of the
academic economics profession in both countries. The book covers key economic
events including the Great Depression, the Second World War, the post-war boom and
the great inflation that overtook it and, lastly, the economic reform programmes
that both Australia and New Zealand undertook in the 1980s. Through the interplay
of economic events and economic thought, this book shows how Australasian
economists influenced, to differing degrees, economic policy in their respective
countries. This book is of great importance to those who are interested in and
study the history of economic thought, economic theory and philosophy, and
philosophy of social science, as well as Australasian economics.

Why another book about Ore Deposits? There are a number of factors which motivated us to write this text and which may provide an answer to this question. Firstly our colleagues are predominantly mining engineers and minerals processing technologists, which provides us with a different perspective of ore deposits from many academic geologists. Secondly we have found that most existing texts are either highly theoretical or merely descriptive: we have attempted to examine the practical implications of the geological setting and genetic models of particular ore deposit types. We have written the text primarily for undergraduates who are taking options in Economic Geology towards the end of a Degree Course in Geology. However, we hope that the text will also prove valuable to geologists working in the mining industry. The text is to a large extent based on a review of the existing literature up to the end of 1984. However, we have visited most of the mining districts cited in the text and have also corresponded extensively with geologists to extend our knowledge beyond the published literature. Nonetheless writing a text-book on Ore Deposits is a demanding task and it is inevitable that sins of both omission and commission have been committed. We would therefore welcome comments from readers which can be incorporated in future editions. The Business of Mining

Essentials of Mineral Exploration and Evaluation

As the importance and dependence of specific mineral commodities increase, so does concern about their supply. The United States is currently 100 percent reliant on foreign sources for 20 mineral commodities and imports the majority of its supply of more than 50 mineral commodities. Mineral commodities that have important uses and face potential supply disruption are critical to American economic and national security. However, a mineral commodity's importance and the nature of its supply chain can change with time; a mineral commodity that may not have been considered critical 25 years ago may be critical today, and one considered critical today may not be so in the future. The U.S. Geological Survey has produced this volume to describe a select group of mineral commodities currently critical to our economy and security. For each mineral commodity covered, the authors provide a comprehensive look at (1) the commodity's use; (2) the geology and global distribution of the mineral deposit types that account for the present and possible future supply of the commodity; (3) the current status of production, reserves, and resources in the United States and globally; and (4) environmental considerations related to the commodity's production from different types of mineral deposits. The volume describes U.S. critical mineral resources in a global context, for no country can be self-sufficient for all its mineral commodity needs, and the United States will always rely on global mineral commodity supply chains. This volume provides the scientific understanding of critical mineral resources required for informed decisionmaking by those responsible for ensuring that the United States has a secure and sustainable supply of mineral commodities.

The Political Economy of Economic Performance

The rising global demand for metals in a context of declining ore grades is driving the opening of new mines and the expansion of existing ones, disturbing substantial land areas (especially by open pits). However, how much land is currently disturbed globally? How much land could be disturbed by metal mining in 2050? This study investigates the global area disturbed by mining of iron, bauxite, copper, gold, and silver for the first time. The first part consists of the calculation of the specific land requirements, i.e. the area newly disturbed caused by the ore
extraction at the mine site. The second part addresses the global area disturbed in the year 2011 whereas the third presents scenarios of how such area might evolve until 2050. The last part addresses the current and future pressures on global biodiversity by metal mines and shows possibilities for the future opening of new mines in low biodiversity areas, alleviating pressures in high biodiversity ones. This study presents the findings of the author’s dissertation hoping they are used as a frame to develop policies and incentives to reduce the amount of area directly disturbed by mines and their pressures on biodiversity.

This book is a comprehensive economic and legal study of the theoretical and practical aspects of the problems of increasing energy efficiency; self-motivation of energy saving by business entities within the framework of their corporate responsibility; regulatory mechanisms to stimulate energy conservation in the economy; civil-law regulation of foreign trade turnover of energy resources between economic entities of the Russian Federation and companies of member states of international integration associations – the CIS, EEMP, the EU and BRICS. It argues that technological energy saving plays a key role in reducing the energy intensity and increasing the energy efficiency of the economy, and substantiates the need for institutional support – including legal support for the participation of the Russian Federation – in various forms of international cooperation. Lastly, based on an analysis of current legislation, programs and recommendations, judicial and contractual practices, customs and trade procedures, it offers proposals for the developing, improving and unifying civil law regulation of obligations in the sphere of international trade in energy resources, as well as methodological recommendations for drafting foreign trade contracts in the energy sector.
